Channel setup guide

WhatsApp · Instagram · Gmail · Shopify

Need a URL?

Settings > Callback URLs

Copy the one you need and paste it into Meta or Google.

How to use this guide

Copy Callback URLs from Settings. Save Instagram and Gmail login redirects in Meta and Google before you click Connect.

Use Settings to connect WhatsApp, Instagram, Gmail, and Shopify. Create credentials in Meta, Google Cloud, or Shopify Admin, then enter them in this product.

Callback URLs live in Settings. Open Settings > Callback URLs, choose WhatsApp, Instagram, or Gmail, and copy. Paste those values into the provider console.

Recommended order: WhatsApp > Instagram > Gmail > Shopify.

1. Before you start

You need:

- Access to Settings
- A Meta developer app (WhatsApp and Instagram)
- A Google Cloud project you can administer (Gmail)
- Shopify Partner or store admin access (optional, for orders)

Do not click Connect for Instagram or Gmail until the login redirect URL is saved in the provider console. Copy it from Settings first, then save it in Meta or Google, then return here and connect.

2. WhatsApp

● Fields in Settings > Connect WhatsApp

Field	Source
Phone Number ID	Meta > WhatsApp > API Setup
Access Token	System User token (see below). Do not use the short-lived token on API Setup.
Verify Token	You choose this value. Use the same string in the Meta webhook.
App Secret	Meta App settings > Basic
Business Account ID	WhatsApp Business Account ID (optional)

● 2.1 Meta app

- 1 Open <https://developers.facebook.com/apps/>

- 2 Create a Business-type app, or open an existing app.
- 3 Add the WhatsApp product.

● 2.2 Phone Number ID and Business Account ID

- 1 Open WhatsApp > API Setup.
- 2 Copy Phone number ID into Settings.
- 3 Copy the WhatsApp Business Account ID if it is shown.

● 2.3 App Secret

- 1 Open App settings > Basic.
- 2 Copy App Secret into Settings.

Instagram uses a different App ID and App Secret. Do not reuse these values for Instagram.

● 2.4 Verify Token

- 1 Choose a string with no spaces.
- 2 Enter it in Settings > Verify Token.
- 3 Enter the same string when you configure the Meta webhook.

● 2.5 Access Token

Tokens on the API Setup page expire in about 24 hours. Create a System User token instead.

- 1 Open <https://business.facebook.com/latest/settings>
- 2 Users > System users > Add (Admin).
- 3 Assign assets: the Meta app (Full control) and the WhatsApp account.
- 4 Generate a token for that Meta app with:
 - whatsapp_business_messaging
 - whatsapp_business_management
 - business_management (if listed)
- 5 Prefer a non-expiring token when Meta offers it.
- 6 Paste the token into Settings > Access Token.

● 2.6 Webhook

- 1 In the Meta app, open Webhooks or WhatsApp > Configuration.
- 2 Callback URL: copy Webhook from Settings > Callback URLs > WhatsApp.
- 3 Verify token: the same value as in Settings.
- 4 Verify and save.

- 5 Subscribe to messages.

If agents also reply from the WhatsApp Business app on the phone, the number must be onboarded with Meta Coexistence, and you should also subscribe to `smb_message_echoes`. A Cloud API-only number will not send phone replies to this product.

2.7 Connect

When the required fields are filled, click Connect in Settings.

Send a test message to the business number and confirm it appears in Inbox.

3. Instagram

You enter App ID, App Secret, and Verify Token only. Access Token and Username are filled after Instagram login. Do not paste a Page ID.

Instagram App ID and Instagram App Secret are not the values from App settings > Basic. Use the pair from Instagram > API setup with Instagram login.

Fields in Settings > Connect Instagram

Field	Who provides it
Instagram App ID	You, from Meta Instagram API setup
Instagram App Secret	You, from the same page
Verify Token	You choose this value
Access Token	Filled after Instagram login
Username	Filled after Instagram login

3.1 Product and scopes

- 1 In the Meta app, add the Instagram product.
- 2 Open Instagram > API setup with Instagram login.
- 3 Copy Instagram app ID and Instagram app secret into Settings (do not click Connect yet).
- 4 After Connect, this product requests:
 - `instagram_business_basic`
 - `instagram_business_manage_messages`
 - `instagram_business_manage_comments`
- 5 Complete Meta App Review for messaging permissions before production use.

● 3.2 Login redirect - save in Meta before Connect

Connect will fail if this URL is missing from the Meta app.

- 1 Open Settings > Callback URLs > Instagram and copy Login redirect.
- 2 Open <https://developers.facebook.com/apps/> and select your app.
- 3 Go to Instagram > API setup with Instagram login > Business login settings.
- 4 Paste the copied value into OAuth redirect URIs.
- 5 Save in Meta.

● 3.3 Webhook

- 1 Open Meta Webhooks for Instagram messaging.
- 2 Callback URL: copy Webhook from Settings > Callback URLs > Instagram.
- 3 Verify token: the Instagram Verify Token from Settings.
- 4 Subscribe to messages.

● 3.4 Connect

Only after the login redirect is saved in Meta:

- 1 Settings > Instagram > Connect.
- 2 Enter Instagram App ID, Instagram App Secret, and Verify Token.
- 3 Click Connect. Instagram login opens.
- 4 Approve as the business Instagram account that should receive DMs.
- 5 You return to Settings with Instagram connected. Access Token and Username are stored for you.

Replies sent in the Instagram app appear here automatically. No extra echo setting is required.

Send a test DM from a customer account and confirm it in Inbox.

4. Gmail

You enter Client ID, Client Secret, and Pub/Sub Topic only. Refresh Token and Access Token are filled after Google login.

After Connect succeeds, mail watch starts automatically and is renewed in the background.

● Fields in Settings > Connect Gmail

Field	Who provides it
-------	-----------------

Client ID	You, from the Google Cloud OAuth web client
Client Secret	You, from the same client
Pub/Sub Topic	You (projects/{PROJECT_ID}/topics/{TOPIC})
Refresh Token	Filled after Google login
Access Token	Filled after Google login

● 4.1 Enable APIs

Use a Google account that can administer the project.

- 1 Open <https://console.cloud.google.com/> and select or create a project.
- 2 Enable Gmail API: <https://console.cloud.google.com/apis/library/gmail.googleapis.com>
- 3 Enable Cloud Pub/Sub API: <https://console.cloud.google.com/apis/library/pubsub.googleapis.com>

Both must show Enabled.

● 4.2 OAuth consent screen and scopes

- 1 Open <https://console.cloud.google.com/apis/credentials/consent>
- 2 Configure the app (External is typical) and a support email.
- 3 Add scopes:
 - <https://www.googleapis.com/auth/gmail.modify>
 - <https://www.googleapis.com/auth/gmail.send>
- 4 Publish the app, or add the support mailbox under Test users until it is published.

● 4.3 Login redirect - save in Google before Connect

Connect will fail with a redirect mismatch if this URL is missing from the OAuth client.

- 1 Open Settings > Callback URLs > Gmail and copy Login redirect.
- 2 Open <https://console.cloud.google.com/apis/credentials>
- 3 Create credentials > OAuth client ID > Web application.
- 4 Under Authorized redirect URIs, paste the copied value and save.
- 5 Copy Client ID and Client Secret for Settings (do not click Connect yet).

● 4.4 Pub/Sub topic and push subscription

You need permission to create topics and edit topic IAM (Owner, or Pub/Sub Admin).

- 1 Open <https://console.cloud.google.com/cloudpubsub/topic/list>
- 2 Create a topic (for example gmail-events).

- 3 Open the topic > Permissions.
- 4 Grant Pub/Sub Publisher to gmail-api-push@system.gserviceaccount.com (Google's Gmail push account, not your user).
- 5 Create a Push subscription on that topic.
- 6 Endpoint URL: copy Push URL from Settings > Callback URLs > Gmail.
- 7 Copy the topic name into Settings: projects/{PROJECT_ID}/topics/{TOPIC}

● 4.5 Connect

Only after the login redirect is saved on the Google OAuth client:

- 1 Settings > Gmail > Connect.
- 2 Enter Client ID, Client Secret, and Pub/Sub Topic.
- 3 Click Connect. Google login opens.
- 4 Sign in as the support mailbox and approve the scopes.
- 5 You return to Settings with Gmail connected. Mail watch starts on its own.

Send a test email to the mailbox and confirm it in Inbox.

Google's push watch lasts up to seven days. This product renews it automatically while the API is running. Click Connect again only if Google revoked access.

5. Shopify

Connect Shopify to show customers and orders in the inbox.

● Fields in Settings > Shopify

Field	Value
Shop subdomain	Subdomain only (yourbrand from yourbrand.myshopify.com)
Client ID	App client ID
Client Secret	App client secret

● Scopes

Minimum:

- read_customers
- read_orders

- 1 Create or open the app in the Shopify Partner or Dev dashboard.

- 2 Install it on the store with those scopes.
- 3 Settings > Shopify > Connect.

WhatsApp and Email can match a Shopify customer by email or phone. Instagram cannot.
